

The Role of the Controller

Controllers support your views by responding to user actions and populating the views with content.

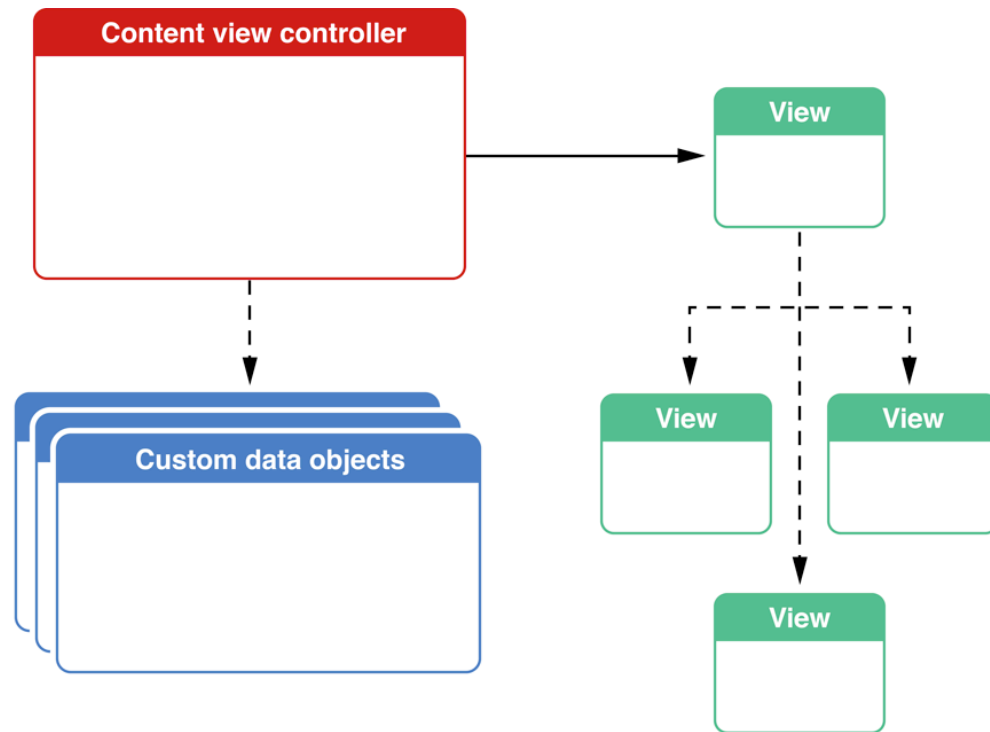

In other words . . .

The VC helps create a link
between visual appearance and app data

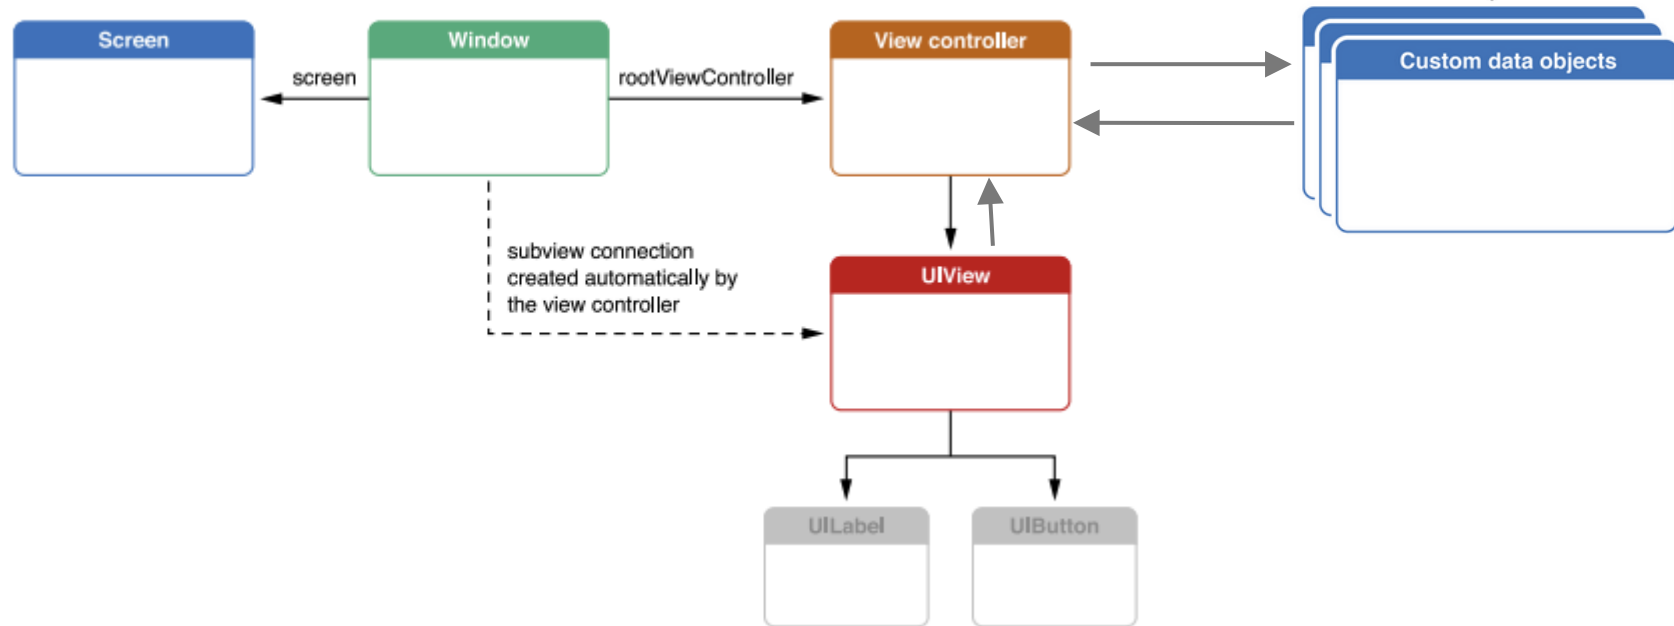

View Controller

A view controller is the natural place to coordinate actions of its connected views.

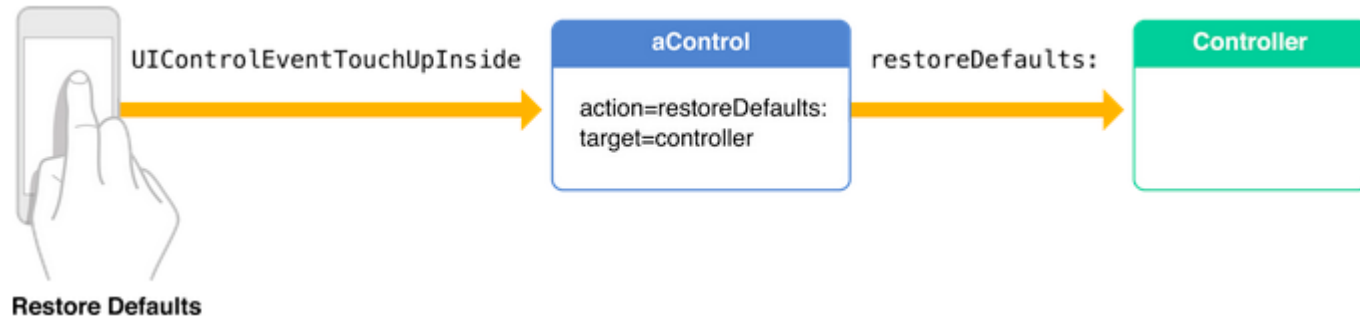

Tying it all together

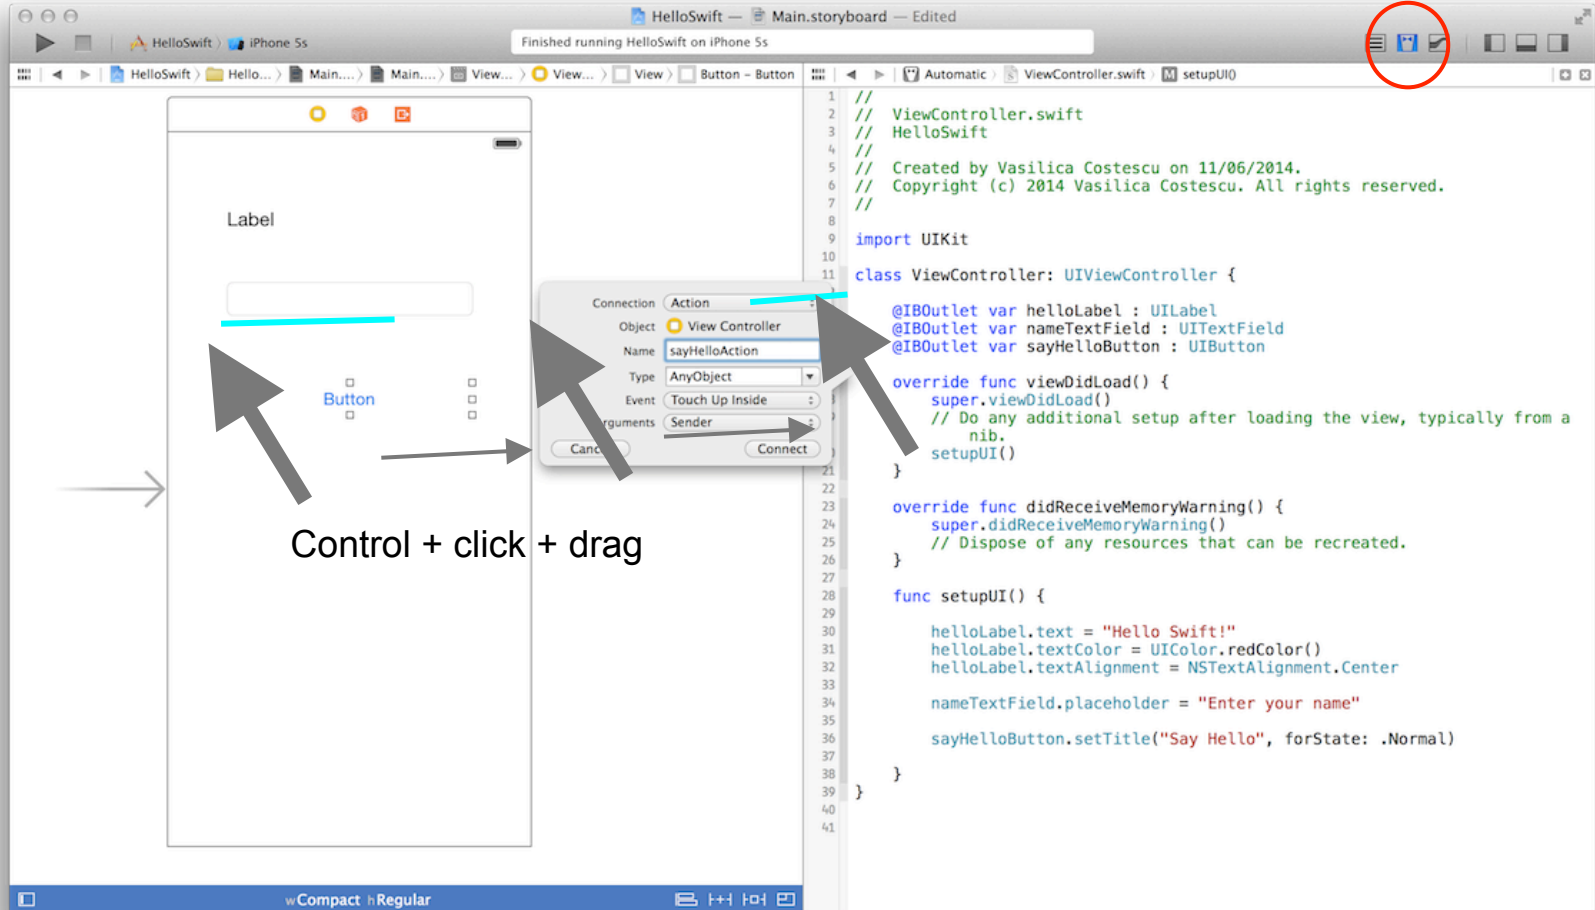

Each view controller organizes and controls a view; this view is often the root view of a view hierarchy.

Connecting View with View Controller

To define interaction in your app, make your view controller files communicate with the views in your storyboard. You do this by defining connections between the UI files and source code files through actions and outlets.

UI Description Files

- Storyboards
- XIB files

UITableViewController and XIB files

- XIB or Storyboard files can be linked to ViewControllers

Linking UIViewControllers and XIB files

- loadView
- init (if loadView is not provided)

Practical aspects of linking UITableViewController and XIB files

- loadView
- init
- Naming XIB files
- Simulator cleanup
- Setting up correct ViewController in IB

Practical aspects of linking UITableViewController

- Every UITableViewController has a 'view' property

Lifecycle methods of UITableViewController

- `loadView`
- `init`
- `viewWillAppear`
- `viewDidLoad`
- `viewWillDisappear`

Let's see the code now ...

A quick demo on simulator reset

Assignment

- Create an additional XIB file in your project
- Set up some UI components in the XIB file
- Add the view from this XIB to your
ViewController
